

This document is a guide to check products against, for a standard level of care and quality of the user experience.

Software Packaging – Local first, player-owned software:

Application includes a README with versioning and contact information.
Application includes pre-requisite software or instructions to get pre-requisite software.
Application window displays the game's official title.
Application has a unique icon (non engine software icon).
Application includes a copy of the active EULA and Privacy Policy, if applicable.
Failure to connect to any external services must not prevent the user from using the Application.
Store page of the application discloses usage of AI in the product's development and usage.
Application must run locally, from one location on the user's file system.
Application must not use or run any kind of software services when closed.
Application must not use any system files. Bring your own files.
Application must not rely on any third party software to run except for distribution platform software used for the sale of the application.

User Interface – Upholding usability standards:

A visual indicator is shown to indicate when the software is writing to the user's device.
Application contains warnings about not abruptly shutting down the software during saving.
Application includes the ability to adjust display settings.
Application includes the ability to adjust input settings.
Resolution changes will automatically revert in 15 seconds if not confirmed by the user.
Any user input fields in the Application include a sanitization mechanism.
Vibration effects must be optional.
If errors occur, the user should see information about the error.
On error, wherever possible, provide solution options to the user.
Any user settings within the application must be provided with visually obvious limits.
All form of input must be accompanied by audio or visual feedback.
If the Application is interacting with a web request, this must be accompanied by a text or visual indicator.

Sensitive Content & Accessibility

If the Application contains sensitive content that is non critical, content can be optionally disabled.
Application warns user of the potential of epilepsy with no prior history of the condition.

Sustainability

As much of the application software as possible is running on the client application.
Any web service software components used by the application are using the most energy efficient provider available.

Privacy and Security

If the application must use any personally identifiable information, this must be disclosed.
Privacy Policy, if applicable, includes clear and truthful details.

Battle Testing

Every Application goes through at least 50 hours of total testing before release.
Any web service software components used by the application have been stress tested for busy conditions.
Application must be tested on ~10 year old hardware.
Application must be tested on every operating system it's publically noted to support.

End of Life

Application must still be functional for all or most of its main selling points if the creator(s), distributor(s), or maintainer(s) for any reason become no longer available.
Any extra or external tool or software used by the application must be able to be packaged and made publically available in some form once the creator(s), distributor(s), or maintainer(s) for any reason become no longer available.
